## VC-3 page 1 of 3

PLEASE USE EXAM BOOKLET TO ANSWER QUESTIONS

**Problem 1** [35 points: Gain Analysis] Consider a MOS amplifier formed by cascading tow common-source stages. Assuming the biasing current sources have very high output resistance, find an expression for the overall low frequency voltage gain  $(\upsilon_O/\upsilon_i)$  in terms of  $g_m$  and  $r_O$  of M1 and M2.

 $g_{m1}$  = Transconductance of M1

 $g_{m2}$  = Transconductance of M2

 $r_{O1}$  = Output resistance of M1

 $r_{O2}$  = Output resistance of M2

## VC-3 page 2 of 3

**Problem 2 [35 points: Biasing]** Find an expression for the output resistance ( $R_{OUT}$ ) of the current mirror shown below in terms of  $g_m$  and  $r_O$  of M1 and M2. To simplify matters, assume that the incremental voltage at the gates of M1 and M2 is zero. (Hint: You can consider the nodes connected to the gates of M1 and M2 as analog ground.)

 $g_{m1}$  = Transconductance of M1

 $g_{m2}$  = Transconductance of M2

 $r_{O1}$  = Output resistance of M1

 $r_{O2}$  = Output resistance of M2

**Problem 3 [30 points: Cascode Amplifier]** The figure shows the circuit of a "folded cascode" amplifier. The circuit avoids transistor stacking characteristic of the cascode configuration and thus provide increased output swing capability.

Assume M1 and M2 have equal g<sub>m</sub> and r<sub>O</sub>.

Assume the current sources I<sub>BIAS1</sub> and I<sub>BIAS2</sub> have infinite output resistance.

 $g_m$  = Transconductance of M1 and M2  $r_O$  = Output resistance of M1 and M2

- (a) (15 points) Find an expression for the low frequency voltage gain ( $\upsilon_{O}/\upsilon_{i}$ ) in terms of  $g_{m}$  and  $r_{O}$ .
- (b) (15 points) The dominant high-frequency pole is usually formed at the output node. If the total capacitance at that node is  $C_L$ , find an expression for the pole frequency ( $\omega_H$ ) in terms of  $C_L$ ,  $g_m$ , and  $r_O$ .
